

# 程式碼架構.

```

myBot.login ( id, ps );
① myBot.toBoard ( 'movie' ); // No CALLBACK
② myBot.pressAnyKey ( function() { CALLBACK 1.
    console.log ( myBot.screen() );
  } );
③④⑤ for ( var i=0 ; i<3 ; i++) {
    myBot.pageUp ( function() { CALLBACK 2
      console.log ( myBot.screen() );
    } );
  }
  
```

Step 1. PttBot 會先將程式碼轉成 commands Array 與對應之 callback Array (新增指令端)

Commands	①	②	③	④	⑤	...
	s movie/r	lr	p	p	p	...
callback	①	②	③	④	⑤	...
	null/Func	CALLBACK1	CALLBACK2	CALLBACK2	CALLBACK2	...

Step 2. Node.js 會根據 commands & callback 產生對應的執行序列 (消化指令端)
